

# Portable terminal

## PORTABLE TERMINAL module

*The portable data terminal (PDT) interface module allows you to carry the product database around the store in a compact, easy to manipulate device.*

*Use it for many types of day-to-day operations including price verifications, receiving, inventory counts, etc.*

### System features include:

- **Price verification and modification**  
Verify items using the built-in scanner with the product label or by entering the product code or supplier code via the keypad. Change the price or the promo price. The data recorded on the PDT is imported by L-BOSS to update its database and transmit the modifications to the POS terminals.
- **Batch file maintenance**  
Use the PDT to create batches for price change or sale batches.
- **Stock control**  
Use the PDT for stock ordering, receiving, adjustments and counts.
- **Label generation**  
Use the PDT to trigger label printing to either a wireless portable printer or to the back-office desktop printer.
- **Line busting**  
Use the PDT to scan in customer orders while they wait in line to speed up the check-out process on busy days.
- **Order preparation**  
Use the PDT to prepare customer orders received by phone or otherwise.

### Portable devices supported

- Devices must be able to run Windows 2000, XP or Windows CE (Pocket PC 2002 and greater) and normally they will use 802.11x wireless networking for connection to the L-BOSS controller.
- The Unitech PDT 600, 630 and 700 models using an RS232 interface. Sufficient memory to load the item file is required in the RS232 style devices. Wireless label printing, line buster and order preparation are not supported with the RS-232 type devices. Those applications require a wireless type unit capable of real time TCP/IP communication with the L-BOSS server.

### System requirements

Windows XP or Windows 2000.  
PC PIII 700 or greater with 256 meg ram and 30 gig hard drive.  
L-BOSS is required to use this optional module.
